DETAILED ACTION

Applicant's request for reconsideration of the finality of the rejection of the last Office action is persuasive and, therefore, the finality of that action is withdrawn.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 11 – 26 are rejected under 35 U.S.C. 102(b) as being anticipated by Yamauchi (JP 10039040).

As to claims 11 – 16, Yamauchi discloses a device for detecting position of buried article comprising opaque surface (5) rendering the object (3) non-visible which comprises providing in the neighborhood of the object (3) a variable strength magnetic field (4), sensing the magnetic field strength at a plurality of positions relative to the object using an array of Hall effect magnetic sensors (1a – 1d), the array of Hall effect sensors (1a – 1d) being associated geometrically with a machining guide, such that the machining guide and the array of sensors (1a – 1d) are fixed positionally one relative to the other, interrogating the sensors (1a – 1d) to determine the value of the field strength at at least the majority of the sensors, analyzing the sensor (1a – 1d) responses to determine the displacement between the object (3) and the machining guide, and

Art Unit: 2862

moving the array and machining guide to a position in which the displacement is a minimum (Fig. 1).

As to claims 17 – 26, Yamauchi discloses a device for detecting position of buried article comprising means to generate a variable strength magnetic field (4), a base member (1) adapted to be placed on or against the surface (5), means in the base member defining a machining guide, an array of Hall effect sensors (1a – 1d) located relative to the machining guide, and means for collecting and analyzing outputs (fig. 2 and 6) from at least some of the sensors (1a – 1d) to provide an indication of the variation of the magnetic field associated with the object (3) relative to the position of the base member (1).

Response to Arguments

Applicant's arguments with respect to claims 11 - 26 have been considered but are moot in view of the new ground(s) of rejection.
